Pavel Diordits

Senior Data Engineer

pavel.diordits@yandex.ru · t.me/PavelDiordits · github.com/DiorditsPV · paveldiordits.site

HIGHLIGHTS

- **6+ years in data.** Senior engineer since 2022, across retail, banking and public sector
- **Pipelines.** Airflow · Spark · Kafka · dbt, batch and near-realtime
- **Production ownership.** 24/7 on-call, under one P1 incident per month
- **High-load services.** Go services up to 3000 rps, 100% test coverage
- **DWH & Data Lake.** Data Vault modelling, marts, data catalog publication

EXPERIENCE

Senior Data Engineer — Jun 2025 — present

X5 Tech

Own the data layer of RVI IBP, a supply chain planning product, end to end and lead the DE track. Migrated calculations and integrations from legacy Hadoop 2 and Airflow 2 to the corporate data platform: Kubernetes, Spark, S3, Iceberg and Trino across four environments, with CI/CD. Now moving the DAGs to in-house Airflow 3. Built an agent-driven delivery process with one human gate, spec approval, and wrote an MCP server for Airflow 3: 19 tools, read-only by default.

Python · Airflow · Spark · Trino · Iceberg · Kubernetes · PostgreSQL · MCP

Senior Data Engineer — Dec 2022 — Jun 2025

Ozon Tech

Built Go services for sales event tracking on core-system data, removing the dependency on other teams' feeds and delivering a near-realtime data model: Kafka consumers with gRPC enrichment, up to 3000 rps at 100% test coverage, rated high-critical with under one first-level incident a month. Also built a stock category calculation service for Ozon fresh, set up the dbt and Airflow development process with CI/CD for stg and prod, and wrote team ETL libraries and Go clients for PostgreSQL and HDFS. On-call 24/7 for first-priority incidents.

Go · Python · Kafka · gRPC · Airflow · dbt · HDFS · PostgreSQL · Redis

Data Engineer — Sep 2021 — Dec 2022

Sber

Developed a DWH for marketing analytics and customer communications across Sber ecosystem products, and migrated legacy Teradata and SAP processes to the Hadoop stack. Built customer scoring and segmentation marts published in the data catalog, delivered with documentation, tests and maintenance.

Scala · Spark · Hadoop · Oozie · Teradata · SAP · SQL

Data Engineer — Feb 2020 — Sep 2021

Moscow Department of Information Technology

Developed a DWH based on the Data Vault model, with a library for source integration and distribution of data across components. Created the process for publishing datamart-layer data to the data catalog and delivered inter-agency data transport and enrichment projects.

Python · Kafka · Airflow · Data Vault · SQL

EDUCATION

BSc, Supply Chain Management — 2018

MADI — Moscow Automobile and Road State Technical University

PROJECTS

lexis — How hard is a book — and what exactly makes it hard?

Scores an EPUB, FB2 or TXT out of ten from four measurable components — words past B2, words rare in general English, mean sentence length, and invented ones like xenonite or allomancy — calibrated on eight books of known difficulty, with the raw values behind every score. Under it sits the vocabulary itself: the Oxford 3000 and the Oxford 5000 increment on an Euler diagram whose areas are exact to the word, every region downloading as a CSV or an Anki deck.

claude-skills — Skill marketplace where the data never leaks

A plugin marketplace of personal agent skills, built on one rule: the code is public, the data a skill accumulates never is. Two branches carry the split — public code on the main branch, working data pushed only to a private remote — and git hooks enforce it mechanically, so the boundary holds without relying on discipline.

agent-team — One manager, permanent roles, disposable sessions — state in git and the tracker

A Python CLI over tmux and Claude Code that raises a project's team from its agents/ folder: a role is one file with instructions, a zone and a restricted tool list, and every role works in its own git worktree. The manager hands out tasks and merges; the approach is borrowed from Gas Town without its stack, and a library of nine ready-made roles ships with it.

ladder — A topic laid out as a board you can actually finish

Lays a topic out as columns by rungs of difficulty: inside every sub-column the cards climb from the basics to the expert question, and you work through them with a known / review / unknown checklist driven from the keyboard. The service database is the source of truth — tracks, columns, rungs and questions are created through an MCP server and its API straight from a Claude session, while the repository carries only the demo layer. Without signing in the site opens as a demo in Russian and English; the full set of topics is by invitation.

journal — Write-ups that publish themselves — and a library built from them

The journal of this site: teardowns of tools and agent practices, plus Agents Weekly, a digest a scheduled agent writes and publishes every Friday with no hand in between. One script keeps the registry and rebuilds the index and the RSS feed; covers are typeset in code from each entry's own numbers and snapped by a headless browser. Every issue is filtered for changelog noise on the way in, and the catalogue items of all issues are extracted into one library with search, topic filters and sorting. Each entry is a single self-contained HTML page with no external requests.

ClawdIcons — VS Code icon theme

File and folder icons for Claude Code artifacts, merged on top of whatever icon theme is already in use, with path-aware badges — only the paths the tool actually reads from get painted.

STACK

Python · Airflow · Spark · Trino · Iceberg · Kubernetes · PostgreSQL · MCP · Go · Kafka · gRPC · dbt · HDFS · Redis · Scala · Hadoop · Oozie · Teradata · SAP · SQL · Data Vault
